

ID-ware

The complete solution for ID and Authorization Management

ID-ware provides complete solutions for the introduction and life cycle management of digital multifunctional IDs and authorizations

About ID-ware

ID-ware supports organizations worldwide with effective solutions for identification and authentication processes. Our enterprise card and authorization management platform is used centrally. The environment in which our clients operate is characterized by complexity and dynamism; That's why we work solution-oriented. Reliability and professionalism are the focus here. In this way, ID-ware contributes to a secure environment, precise personnel management and efficient business processes, and does exactly the tailor-made work our customers need.

We offer you:

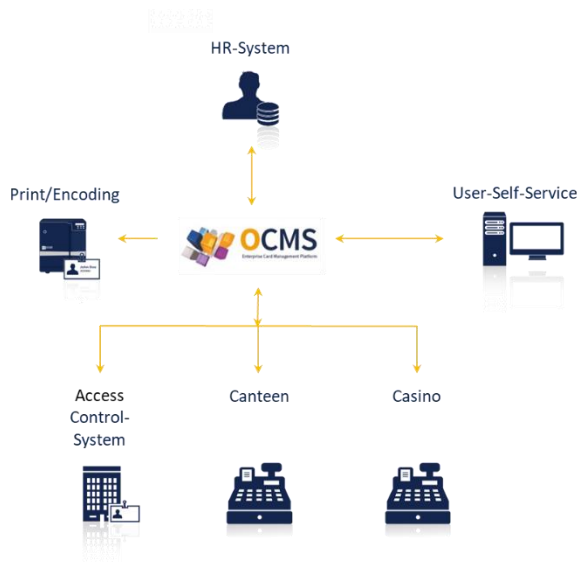

- ID-Credential Management
- Authorization Management
- User Self Service
- Visitor Management Portal
- Contractor Management Portal
- Fully integrated with the common access control systems
- Auditability

Online Card Management System (OCMS)

The OCMS is a fully integrated enterprise platform for managing the lifecycle of access and ID credentials of individuals, regardless of the access control systems they use.

Standard interfaces to common identity management, HR systems and directory services are available. The OCMS transmits card authorizations to connected systems such as access control, work time recording, canteen billing and follow-me-printing.

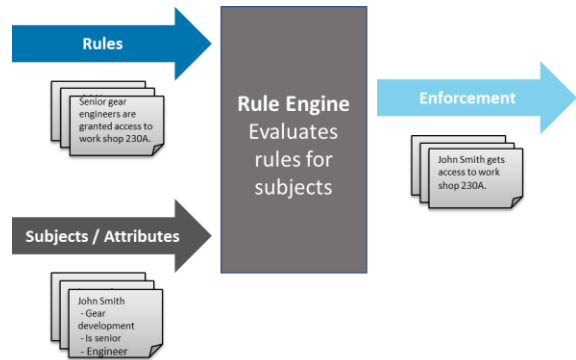

Access Management

Rule Engine

The ID-ware Rule Engine is part of the identity management and authorization management system OCMS and is used for the automatic evaluation and granting of authorizations based on rules.

As part of the execution of the Rule Engine, the rules stored in the OCMS are taken into account in the status 'Active' and evaluated via the relevant subjects / personal data records. As a result, the usually defined access authorizations (access templates) are assigned or withdrawn to the respective subjects / persons.

Benefits Rule Engine:

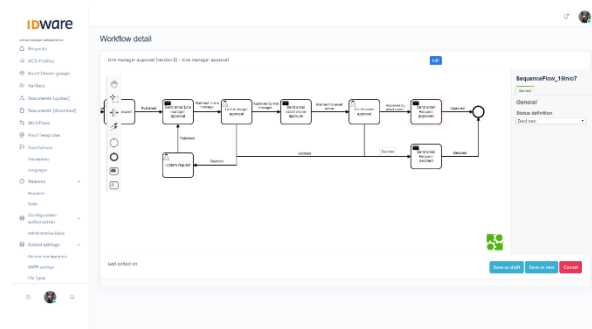

- Fully automatic evaluation and authorization
- Realtime assignment / withdrawal of current access authorizations
- Significant reduction in administrative burden
- Guaranteed compliance with company policies
- Auditability

Workflow Engine

The ID-ware Workflow Engine allows the customer-specific definition of request and approval processes for access authorizations. In contrast to the rule engine, the assignment / withdrawal of access permissions doesn't take place automatically, but by initiating the request process by an OCMS user.

With the flexible Workflow Engine of the OCMS, any administrative processes are seamlessly mapped in the system.

The Workflow Engine has a graphical editor with which the workflows can be defined.

Benefits Workflow Engine:

- Fast implementation of specific access authorizations
- Graphical Workflow Editor
- Process compliance
- Easy to use
- Cost savings
- Auditability

User Self Service

In principle, all system functions can be performed by "classic" system users (reception, ID card office, etc.). In addition, it is also possible to use the user self service to actively integrate different user groups in the process.

This allows self service users to manage their own access requests and their user data. For example, photos can be uploaded or broken or lost IDs reported, as well as a new ID card or extra permissions are requested.

Room managers can see at a glance who has access to their area of responsibility and for what reason. Access authorizations can be revoked immediately if necessary.

Benefits User Self Service:

- Easing the burden of system user
- End users can view their user data and access requests / permissions at any time
- Room managers see at a glance who has access to their area of responsibility
- Increase security level - end users can block lost credentials at any time

Visitor Management Portal

ID-ware Visitor Management is the solution for a modern and efficient management and implementation of the visitor process. Queues are thus avoided and employees relieved.

As usual, the host creates a visit in Outlook and loads the visitor management via email address as guest. Then he marks the external visitors in the Visitor Management Host Portal and they receive a registration email (not yet registered visitors) or invitation email (registered visitors).

Visitors can enter their data in the Visitor Portal including the number of an official document, confirm the appointment and receive a QR code. The host will be informed about the appointment confirmation.

At the appointment the visitor checks-in at a self-service terminal (identification via QR code and authentication via official document).

The host then receives the information that the visitor is checked in and can be picked up.

Optionally, the issuance of a visitor badge with automatic activation and access authorization to the place of appointment is possible.

Benefits Visitor Management Portal:

- Efficient management and implementation of the visitor process
- Avoiding queues at the reception
- Easy handling via Outlook and Visitor Portal
- Registration / check-in is done by the visitor
- Reduction of the workload at the reception based on the automated processes

Contractor Management Portal

The Contractor Management Portal can be made available by customers to external suppliers or service providers, in order to collect and maintain the data of their employees, who need an access authorization at the customer. Thus, the timeliness of the data is ensured by the respective contractors and relieved the customer's staff regarding the data maintenance.

The details are, for example, company data and contact persons, assignment of contracts and projects, work permits depending on the country of origin, etc.

Benefits Contractor Portal:

- Relieving the customer's employees
- Capturing, maintenance and updating of external company employee data is carried out by the external companies
- Application / Report loss of contractor ID cards
- Application for access authorizations (including approval processes and document confirmation / upload)
- Automatic blocking of ID cards / access authorizations with contract termination
- Process compliance

Services

ID-ware offers independent consulting services in the areas of key management, process design (lifecycle management), smart card introduction and migration, chip technology selection, layout design (security elements) and chip design (coding regulation).

In addition to these consulting services, ID-ware offers services in the following areas:

- Project Management,
- Service Desk,
- On-site Services.
